                                                                                           The invention relates to a combination which, comprises a number of CC polynucleotide probes comprising a sequence selected from one of the 1490 CC sequences mentioned in the specification. The combination is useful as an CC array element in a microarray for monitoring the expression of a number CC of target polynucleotides. The microarray is particularly useful in the CC diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug CC discovery and development, toxicological and carcinogenicity studies, CC forensics and pharmacogenomics. The microarray is also useful for CC monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The CC combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The CC carray can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose CC various diseases including cancer e.g. adenocarcinoma and leukaemia, CC immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzheimer's disease and For diagnose of the invention. Note: The sequence tapsesents a polynucleotide CC probe of the invention. Note: The sequence data for this patent did not commat directly from USPTO at the Invention of the printed specification but was obtained in electronic command the converse commence the Interconverse co

The invention relates to a composition of polynucleotide probes
CC comprising first polynucleotide probes comprising at least a portion of a
CC gene encoding a receptor-like polypeptide, second polynucleotide probes
CC comprising at least a portion of a gene encoding a transducing
CC of a gene encoding an effector-like polypeptide. The probes of the
CC composition are useful as array elements in a microarray for monitoring
CC diagnosis and treatment of cancer, an immunopathology or a
CC diagnosis and carcinogenicity studies, forensics or pharmacogenomics.
CC Microarrays can also be used for drug discovery and development,
CC Microarrays can also be used for monitoring the propession of diseases
CC Microarrays can also be used for monitoring the progression of diseases
CC microarray can also be used for monitoring the progression of diseases
CC microarray can also be used for monitoring the progression of diseases
CC microarray can also be used for monitoring the progression of diseases
CC microarray can also be used to purify a subpopulation
CC of mRNAs, cDNAs, or genomic fragments in a sample. The expression profile
CC is also useful for the diagnosis and treatment of cancer, e.g. cancers of
CC the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix,
CC an immunopathology, e.g. AIDS, diabetes, pancreatitis, osteoporosis or
CC ulcerative colitis, or a neuropathology, e.g. dementia, ammesia,
CC epilepsy, Alzheimer's disease or depression. This sequence represents a
CC bhained in electronic format directly from USPTO at

                                                                                in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polynucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                               The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer

The invention relates to nucleic acid markers which are overexpressed in covarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides concerned by the markers, antibodies that selectively bind to the corresponding to a marker of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer invention and a method of treating a patient at risk control normal (i.e. non-covarian cancer inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense ollgomucleotide complementary to a marker of the cinvention. The markers are useful for assessing if a patient is afflicted with ovarian cancer sample. A difference between the capression levels indicates ovarian cancer: The level of expression of the marker in a control non-ovarian cancer sample. A difference between the capression levels indicates ovarian cancer: The level of expression of a marker in a control non-ovarian cancer: The level of expression of a capression of the marker in a control non-ovarian cancer. The presence of protein or protein cappending to the marker. The presence of protein or protein cappending to the marker. The presence of protein or protein cappending to the marker. The presence of protein or protein cappending to the marker. The presence of a transcribed cappending to the marker. Alternatively, the level of expression of the marker in a portion of the marker is also used for monitoring the marker, under stringent conditions. The patient which involves detecting expression. The method at a subsequent time and comparian tissue sample. A composition comprising a marker in a patient conversion the expression. The method at a subsequent conversion the involves detecting expression. The method at a subsequent conversion to the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-MAR-2000; 2000US-0191031P.

```
This invention relates to a combination comprising several cDNAs that are differentially expressed in activated vascular tissue. The invention also colored conditions as high throughput method for detecting differentially expressed conditions in a sample. The cDNAs of the invention may have antiarteriosclerotic; cytostatic; cardiant, hypotensive; antidiabetic; cymaecological; vasotropic and cerebroprotective activities and may be used in gene therapy. The cDNAs of the invention may be used in a high-condition and the condition of the invention may be used in a high-condition. A protein encoded by the cDNA may be used in a high-condition and protein encoded by the cDNA may be used to screen several molecules or compounds to identify a ligand that specifically binds a cDNA of the condition of the used to detect a protein in a sample or purify a natural or compound; the condition of the protein that can be used to detect a protein in a sample or purify a natural or conditions to injury, restension, diabetes, pre-clampsia, isohaemia-reperfusion conditions, treating, or monitoring the progression of treatment conditions, hypertension, diabetes, pre-cclampsia, isohaemia-reperfusion conditions, the protein also be used for large-scale genetic or gene expression analysis of several new mucleic acid conditions pre-pathologic disorders, and chronic or acute disease genetic or gene expression analysis of several new mucleic acid conditions pre-pathologic disorders, and chronic or acute disease genetic or gene expression analysis of several new mucleic acid conditions pre-pathologic disorders, and chronic or acute diseases conditions are proteins and conditions of the protein acid molecules for this patent sequence represents a cDNA of the invention conditions of the protein conditions of the condition, but the condition of the protein conditions of the protein conditio
Combination for diagnosing, staging, treating, or monitoring the progression of treatment of a vascular disease, e.g. atherosclerosis, comprises several cDNAs that are differentially expressed in activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   28-JUL-2000;

```

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polynucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protoconcogene that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these cDNA molecules as useful for in hybridisation assays to detect expression of nucleic acids for complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the cDNA as a light toytostatic activity and can also be used for gene therapy purposes. This polynucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an the printed specification but has been obtained in electronic format from the US Patent Office at ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009.

EX XX

New gene markers e.g. serine or cysteine protease inhibitor gene, major PT histocompatibility complex class II gene specific for mesenchymal stem cells, useful for detecting and identifying mesenchymal stem cells. SEQ ID NO 19; 171pp; Japanese.

XX

Claim 1; SEQ ID NO 19; 171pp; Japanese.

XX

The invention relates to marker genes for detecting mesenchymal stem cells. Selected from approximately 145 genes. The mesenchymal stem cell CC marker genes include the serine (or cysteine) protease inhibitor gene (C (ADS19160), the adrenomedullin gene (ADS19161), the apolipoprotein D gene (C (ADS19163), the collagen type XV alpha 1 gene (ADS19165), the CUG triplet CC repeat RNA binding protein 2 gene (ADS19165), the dermatopontin gene (C (ADS19163), the isocitrate dehydrogenase 2 gene (ADS19165), the major CC (ADS19171), the Sam68-like phosphotyrosine protein (ADS19170), the major CC (ADS19171), the Sam68-like phosphotyrosine protein (ADS19170), the major CC (ADS19177), and the tissue factor pathway inhibitor 2 gene (ADS19178). The invention also relates to marker gene-specific probes and CC pene (ADS19179) and real-time PCR primers specific for marker genes of the CC propertion (ADS19179) and antibodies specific for marker genes of the CC propertion (ADS1917) and antibodies specific for them; and kits comprising such probes microarrays, primers comprising probes microarrays or antibodies for identifying mesenchymal stem CC pathway inhibitor 2 gene and antibodies specific for marker genes of the CC propertion (ADS1917) and antibodies specific for them; and kits comprising probes microarrays, primers comprising probes microarrays, primers can define the primers and comprising the expression level of a comprising some sequence represents a specifically claimed human tissue factor pathway inhibitor 2 cDNA.

Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and a non cancer patient.

Disclosure; Page 437; 481pp; English.

The present invention relates to a new method for assessing whether a gatient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the general cancer tends of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as comparing cancer (e.g. patients having an enhanced risk of developing covarian cancer (e.g. patients having a familial history of ovarian cancer). The cancer markers may be used in the management and treatment concer). The cancer markers may be used in the management and treatment concer). The cancer markers may be used in the management and treatment concer). The cancer markers may be used in the management and treatment concer). The cancer markers may be used in the management and treatment concer). The cancer markers may be used in the management and treatment concer) creaters (e.g. bacterial or viral meningitis), concephalus or brain herniations), confident (e.g. cerebral oedems, hydrocephalus or brain herniations), confident (e.g. bacterial or viral meningitis or encephalitis), confident (e.g. bacterial or heart disorders (e.g. ischaemic heart (e.g. bacterial or historian cancer (e.g. ischaemic heart (e.g. bacterian cancer, motioning the progression of ovarian cancer, determining the progression of ovarian cancer, determining covarian cancer or at risk of developing ovarian cancer. The present nucleic acid invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for detecting a lung cancer-associated CC transcript in a cell from a patient, comprising contacting a biological CC sample from the patient with a polynucleotide that selectively hybridies CC to a sequence that is at least 80 % identical to a gene that exhibits CC increased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a CC compound that modulates a lung cancer-associated polypeptide, for CC cancer in a patient and for treating a mammal having lung cancer by CC cancer in a patient and for treating a mammal having lung cancer by CC cancer in a patient and for treating a mammal having lung cancer by CC cancer in a patient and for treating a mammal having lung cancer by CC compound that sering a modulatory compound identified. The methods are useful CC lung cancer or other benign or precancerous lesions, e.g. atelectasis, CC emplysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, CC emplysema, bronchitis, interstitial pulmonary fibrosis, asthma and CC compounds that modulate lung cancer, such as antibodies. Sequences CC cancer in a patient of the lung cancer, such as antibodies. Sequences CC compounds that modulate lung cancer, such as antibodies. Sequences CC compounds that modulate lung cancer associated polynucleotides of the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Detecting angiogenesis-associated transcript in a cell for diagnosing treating cancer by contacting a sample with a polynucleotide that exhibits changes in expression level as a function of time in tissue undergoing angiogenesis. and

Example 2; Page 205; 291pp; English

The present invention relates to methods and compositions for detecting CC an angiogenesis-associated transcript in a cell in a patient. The method CC involves contacting a biological sample from the patient with a CC polynucleotide that selectively hybridises to a sequence at least 80% CC identical to any of the angiogenesis-associated human polynucleotide sequences comprise genes angiogenesis-associated CC polynucleotide sequences comprise genes that exhibit changes in CC expression levels as a function of time in tissue undergoing CC angiogenesis. The method and the polynucleotide sequences of the CC invention are useful for diagnosing and treating angiogenesis and CC angiogenesis-associated diseases e.g. cancer. The polynucleotide sequences are also useful in the gene therapy of such disorders. The CC angiogenesis-associated protecins encoded by the polynucleotide sequences are useful as a vaccine for therapeutic and prophylactic immunisation. CC ABX08739.ABX08853 represent angiogenesis-associated polynucleotide

```

```
Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                    Glynne R,

```

CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclaristaion syndromes; scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

Sequence 1142 BP; 316 A; 248 C; 260 G; 318 T; 0 U; 0 Other;

99.3%; Score 972.2; DB 11; Length 1142; 99.7%; Pred. No. 9.9e-256; tive 0; Mismatches 3; Indels 0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC The PRO proteins are useful for diagnosing and treating a B cell related CC disorder, e.g. X-linked infantile hypogammaglobulinemia, polysaccharide CC antigen unresponsiveness, selective IgA deficiency, selective IgA cefficiency, selective IgA cefficiency, selective IgA cefficiency, selective IgA cefficiency with CC lyper IgM, transient hypogammaglobulinemia of infancy. Burkitt's CC lypersensitivity, rheumatoid archritis, autoimmune mediated haemolytic CC anaemia, myasthenia gravis, hypogatenocorticism, glomerulonephritis, or CC antylosing spondylitis. The PRO proteins are also useful for preparing a CC grotein, e.g. cancer or immune-mediated inflammatory diseases. The PRO CC coding sequences are useful as hybridization probes in chromosome and CC gene mapping, in preparing PRO proteins, or in generating transgenic CC animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents.

This invention relates to a novel isolated nucleic acid associated with CC bronchial cancer comprising 489 defined sequences given in the CC specification. The invention may be useful for the production of CC compounds with a cytostatic activity through the inhibition of expression CC cractivity of tumour-associated proteins. The novel DNA sequences and CC cancer or determining the risk of developing it and to screen for CC specific binding partners of the DNA or protein sequences, where the CC inding partners are potentially useful as agents for treating or CC diagnosing bronchial cancer. The DNA or protein sequences can also be used for prognosis, detection of metastases and for secondary treatment CC (of tumours that have been stabilised or are no longer detectable). CC Detecting abnormal expression of the DNA sequences parvides early CC diagnosis of bronchial cancers. The present sequence is that of a novel bronchial cancer-associated human gene sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for measurement of levels of visceral adipose tissue using markers. The invention also provides visceral adipose secreted proteins and their nucleic acids which are used as markers. The invention is useful in screening assays for identifying a compound that interacts with the visceral adipose secreted proteins and in the treatment of metabolic syndromera. The present sequence is human tissue factor pathway inhibitor 2 (TFPI-2; also termed as PPS, placental protein 5) coding DNA sequence which encodes one such adipose secreted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Selectable marker; metabolic disorder; metabolic; screening; tissue factor pathway inhibitor 2; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human tissue factor pathway inhibitor 2 (TPPI-2) DNA, SEQ ID NO: 23.

let strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pcMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       - Web: www.genoscope.cns.fr)

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genoscope.
